

josh InfoSign

Complementary tools for **josh**

josh: one Brand, one Technology
one Solution

Digital signature and mark in harmony with **josh**.

Sign, time stamp and check: all integrated with the josh suite.

WHAT IS JOSH INFOSIGN?

josh InfoSign is a josh software module designed to perform all Digital Signature and Time Stamp operations, not to mention the reading and checking of signed and/or marked files including the pertinent signature and mark certificates.

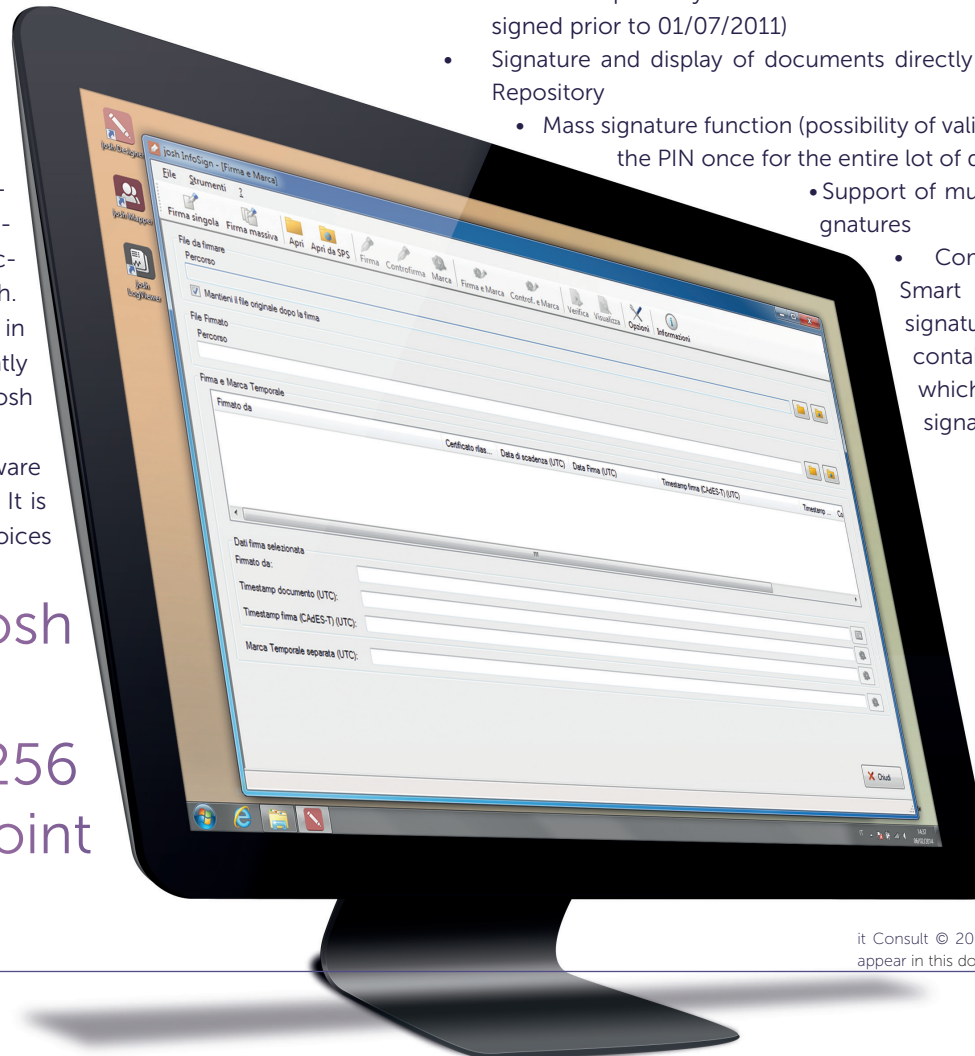

The Digital Signature is an additional attribute of the electronic document on which it is used and it insures its integrity and authenticity, guaranteeing full probative effectiveness. It therefore replaces and surpasses an autograph. josh InfoSign can directly sign and display documents in Microsoft SharePoint Document Library, thus transparently and cohesively integrating with josh processes or with josh protocol! processes.

The tool is included in the josh and josh Protocol! software packages and is an option in the josh Archive! package. It is perfect for undersigning contracts, documents, and invoices online using a digital signature.

Total integration with josh
Standards compliance
Compatible with SHA-256
Integration with SharePoint

MAIN FUNCTIONS

- Integration with josh processes with the possibility of directly calling up options for signature or check, relieving the user of having to save or upload.
- Conformity with all Italian legislation and, in particular, with the technical specifications of the new CAD (Digital Administration Code)
- Full support to the CADES signature format (operationally the signed documents take on the additional extension .P7M which prevents them from being directly opened by the application that generated them)
- Use of the SHA-256 source code
- Retro-compatibility with the SHA-1 source code (to maintain support to files signed prior to 01/07/2011)
- Signature and display of documents directly from the Microsoft SharePoint Repository
 - Mass signature function (possibility of validating the signature by inserting the PIN once for the entire lot of documents to be signed)
 - Support of multiple signatures and countersignatures
 - Compatibility with a vast range of Smart Cards and relative Readers or signature Tokens (a safe device that contains the digital certificates from which the software can generate a signature)
